Willus Infrastructure: Delivering safe and secure pre-engineered buildings

As we all know that **Pre-engineered metal buildings (PEB)** were introduced in India in the mid-1990s. This rapidly growing industry has seen enormous growth in past few decades. The economics and speed of pre-engineered metal buildings is much superior to the traditional **concrete** and conventional **hot rolled steel structures** that dot the Indian landscape. Steel buildings are typically safer than the conventional structures. The performance of steel buildings is more readily visible if the steel building is properly designed, fabricated and erected in systematic manner.

Nowadays the concept of PEB is changed and is one of the most acceptable construction technologies for all **industrial** and **commercial buildings**. There are various type of PEB manufacturers who are serving the Indian market – the one is fully integrated global players with **manufacturing facilities** in India, domestic integrated **manufacturers**, and many small scale manufacturers. Due to the fierce competition, the Indian PEB industry is primarily driven by cost. However, the approach should consider quality as their main priority. The most important aspect before finalizing a vendor is the complete building package of the PEB is supplied by a single vendor. Thus, the compatibility of the building components can be fully assured.

“Being a PEB expert and serving this industry from last 30 years makes me belief that that along with the **innovative solution, technical expertise**, state-of-the-art manufacturing and all major aspect including **in-house** capabilities together, but our set of team plays a very important role,” says **Ritesh Bhandari, Managing Director, Willus Infrastructure**.

“Today **Willus Infrastructure** is reaching heights with the 100% customer satisfaction is because of the “Team” we have, the expertise, the knowledge, the trust, the belief, the commitment we have,” adds Ritesh Bhandari. These all aspects sets us apart from the other PEB players serving the similar segment.

PEB is all about validation and systems .the error free building is the key to customer satisfaction and building performance. It’s a common saying that when you work you make mistakes but it’s the systems which identify in early stages and correct it .balancing of team is also important .one department inefficiency can spoil the excellent performance by other departments. “We have set the standard strictly and adhered to follow the same. For us life safety is more important, and it is reflecting in all our **PEB design** and safety procedure,” says Ritesh Bhandari. The concept has been gaining momentum and the scope of growth is guaranteed looking at India's huge infrastructural requirements. The Increased awareness by consultants, specifiers, and building owners in understanding a uniform value for minimum structural standards is critical to the future of safe PEBs in India.

“Together we are pledging to provide 100% safe and secure buildings in years to come,” asserts Ritesh Bhandari.
